HIGHEST GLYCOSYLATION APPEARS TO OCCUR ON SER RESIDUES WHICH HAVE GLY AT POSITIONS AT +2 OR -2 FROM THE GLYCOSYLATION SITE OR, WHERE GLY IS THE PENULTIMATE RESIDUE. THE PERESENCE OF PROLINE (USUALLY AT POSITION +3 OR -3) APPEARS TO ALSO ENHANCE GLYCOSYLATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gerken T.A., Owens C.L., Pasumarthy M.;

"Determination of the site-specific O-glycosylation pattern of the porcine submaxillary mucin tandem repeat glycopeptide. Model proposed for the polypeptide:galnac transferase peptide binding site.";
J. Biol. Chem. 272:9709-9719(1997).
-!- FUNCTION: APOMUCIN IS PART OF MUCIN, THE MAJOR GLYCOPROTEIN STYNTHESIZED AND SECRETED BY MUCOUS CELLS OF THE SUBMAXILLARY GLAND. ITS HIGHLY VISCORS AQUEOUS SOLUTIONS SERVE TO LUBRICATE THE ORAL CAVITY AND TO PROTECT IT FROM THE EXTERNAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIMILARITY: Contains 1 VWFC domain.
SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBUNIT: INTERMOLECULAR DISULPIDE BONDS COULD HELP MAINTAIN A MULTIMERIC MUCIN STRUCTURE.
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: SUBMATILIARY MUCOSAE.
DOMAIN: CONTAINS TANDEMLY REPEATED, IDENTICAL SEQUENCES OF 81

                                        CATALYTIC ACTIVITY: Hydrolysis of 1,4-alpha-glucosidic linkages in
                                                           polysaccharides so as to remove successive maltose units from the non-reducing ends of the chains.

CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic linkages in oligosaccharides and polysaccharides and polysaccharides.

SUBCELLULAR LOCATION: Secreted.

SIMILARITY: In the N-terminal section; belongs to family 14 of glycosyl hydrolases.

SIMILARITY: In the C-terminal section; belongs to family 13 of
  PRODUCE MULTIFORM BETA-AMYLASES AND A 48 KDa ALPHA-AMYLASE AFTER

-I-PTM: Contains mostly chondroitin sulfate, but also keratan sulfate chains, N-linked and O-linked oligosaccharides.
-I-DISEASE: Defects in AGC1 are the cause of cartilage matrix deficiency (CMD). CMD is an autosomal recessive syndrome characterized by cleft palate, short limbs, tail and snout.

Mutation in strain CMD causes absence of aggrecan by truncation of the protein (mutation in mimunoglobulin-like V-type domain.
-I-SIMILARITY: Contains 1 limmunoglobulin-like V-type domain.
-I-SIMILARITY: Contains 1 Loft-like domain.
-I-SIMILARITY: Contains 1 Sushi (SCR) domain.
-I-SIMILARITY: Contains 1 Sushi (SCR) domain.
-I-SIMILARITY: Belongs to the aggrecan/versican proteoglycan family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             similarity).

DOMAIN: Two globular domains, Gl and G2, comprise the amino terminus of the proteoglycan, while another globular region, G3, makes up the COOH terminus. Gl contains link domains and thus consists of three disulfide-bonded loop structures designated as the A, B, B' motifs. G2 is similar to G1. The keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2 and G3.
                                                                                                                                                                                                                                                                                                                                                                                                                    J. Biol. Chem. 274:2044-20449(1999).

-!- FUNCTION: This proteoglycan is a major component of extracellular matrix of cartilagenous tisues. A major function of this protein is to resist compression in cartilage. It binds avidly to hyaluronic acid via an amino-terminal globular region. May play a regulatory role in the matrix assembly of the cartilage.
-!- SUBONIT: Interacts with FBLN1.
-!- SUBORIL!! ACCATION: Secreted; extracellular matrix (By

"Cloning and sequence analysis of a partial CDNA for chicken cartilage proteoglycan core protein.";

Proc. Natl. Acad. Sci. U.S.A. 83:5081-5085(1986).

-!- FINCTION: This proteoglycan is a major component of extracellular matrix of cartilagenous tissues. A major function of this protein is to resist compression in cartilage. It binds avially to hyaluronic acid via an amino-terminal globular region. May play a regulatory role in the matrix assembly of the cartilage.
-!- SUBCELLULAR LOCATION: Secreted; extracellular matrix (By

-!- DISEASE: DEFECTS IN AGCI ARE THE CAUSE OF NANOMELIA, A LETHAL CONNECTIVE IN AGCI ARE THE CAUSE OF NANOMELIA, A LETHAL CONNECTIVE TISSUE DISORDER APPECTING CARTILAGE DEVELOPMENT INTECTIVE TISSUE DISORDER AFFECTING CARTILAGE DEVELOPMENT LIMBS.

(CHONDRODYSTROPHY) CHARACTERIZED BY SHORTENED AND MALFORMED LIMBS. AGGRECAN IS TRUNCATED AT ITS C-TERMINAL IN THE CS-2 BINDING DOMAIN AND IS NOT ANYMORE SECRETED FROM THE CHONDROCYTES.
-!- SIMILARITY: Contains 1 immunoglobulin-like v-type domain.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                               Isoid=P07898-2; Sequence=VSP 003073; DOMAIN: Two globular domains, Gl and G2, comprise the amino terminus of the proteoglycan, while another globular region, G3, makes up the COOH terminus. Gl contains link domains and thus consists of three disulfide-bonded loop structures designated as the A, B, B' motife. G2 is similar to G1. The keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2

"A gene involved in quinate metabolism is specific to one DNA homology group of Kanthomonas campestris.";
J. Appl. Microbiol. 87:649-58(1999).
-!- CATALYTIC ACTIVITY: Quinate + pyrroloquinoline-quinone = 5-dehydroquinate + reduced pyrroloquinoline-quinone.
-!- COPACTOR: PQQ (By similarity).
-!- ATHWAY: Quinic acid catabolic pathway; first step. This pathway allows growth of bacteria with quinate by its conversion to protocatechuate and subsequent metabolism by the beta-ketoadipate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   404 YATNDLTKWDSG-----GQIHIAPMVKGLEETAVNDLISPPSGAPLISALGDLGGFT---

                                                                                                                                                                                                                                                                                                                                                     SIMILARITY: Belongs to cellulase family A (family 5 of glycosyl hydrolases).
                                                                                                                                                                                                                                                                                     linkages in cellulose, lichenin and cereal beta-D-glucans. PATHWAY: Cellulose degradation.
SIMILARITY: Contains 2 fibronectin type III domains.
SIMILARITY: Contains 1 bacterial-type cellulose-binding (CBD)
                                                     01-OCT-1996 (Rel. 34, Last sequence update)
10-OCT-2003 (Rel. 42, Last annotation update)
Endoglucanase D precursor (EC 3.2.1.4) (Endo-1,4-beta-glucanase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ; Score 145; DB 1; Length 747;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
